```

Using Machine Learning

- Training Data
- Input : (xpos,ypos) when you click
- Output : (element)
- So AI can distinguish clicking ad itself or ad-dismiss button
- miss-click-free click

```
[15]: print(predict(model, 1e, 130, 20))
```

The image shows a Jupyter Notebook interface with a dark theme. A code cell is visible, containing the line `print(predict(model, 1e, 130, 20))`. The cell is numbered [15] and has a green checkmark and '0초' (0 seconds) indicating it has been executed successfully. Below the code cell, there is a dropdown menu with three dots and the letter 'C'.
